

Challenge 11 - JavaScript

For this week you need to make a keyboard on click. You can see the layout of the keyboard and all the functionalities in the video.

In HTML, there should be one div with `<h1> TI ISPISA: </h1>` and a blank `<p>` below it (in which you will need to add letters per click). Under them, how do you want to make the keyboard (with buttons/divs - is your choice).

In JS, you need to select all the buttons/divs at once (paste the same class to make your job easier), iterate through them with `forEach`, and add an event listener on click to all of them at once.

When the appropriate letter is clicked, it should be typed in the blank `<p>`.

Evaluation system:

3 points - Complete the whole page using HTML & CSS (with background, and hover on the buttons/divs). The page doesn't need to be responsive.

5 points - All of the above, plus functionality with js.

Deadline:

2 weeks after its presentation, 23:59h end of the day.
